GRACIAS

MERCI

FOR CHOOSING

CO2BAG.

www.co2add.com

- 1.Store the bag in cool and dry place. Temperature Below+18C (64F)
- 2.Shake And Squeeze The Bag Before Using.
- 3.Make 3-6 holes with a pencil to the upper part of the bag. When the powder level drops, make 2-4 holes closer to the powder. Use Always Protective Gloves
- 4.Hang the bag higher than the Plants, but not straight above the plants. Make sure that the ventilation in your growing room does not push the CO2 from the bag straight outside. Close To Air Intake Is Good.
- 5.It might take 1-3 days after making the holes for bags to activate, so please be patient when measuring the ppm (CO2)levels.
- 6.If Humidity Is Too High,and the bag starts to collect water, make 2-3 holes in the bottom with a pin or needle, so that the moisture can come out.
- 7.If powder level does not change 1-3weeks, the bag is too dry. In that case make Approx. 1 inch cut in the upper part the bag, and add 1-10ml of clean water, 1ml at a time to keep the process going.
- 8.Humidity levels between 45%-70% are preferable.
- 9.Bag starts slowly producing CO2 when temperature rises above +20C but +25C-+30C is recommended.
- 10.The bag can produce CO2 for 1-3 months depending on ventilation, heat, humidity and amount of holes in the bag.
- 11.Recommended Room size 5m2

Keep out of reach of children!

THANK YOU!
